

Here's how I I built an app that predicts the World Cup winner with AI.

And how you can do this too using
GDP data, FIFA rankings, and zero
prior coding knowledge.

Swipe to learn

Christian Martinez

Senior Finance Transformation Manager

A member of AI Finance Club started a fantasy World Cup league.

**I wanted an edge.
So I built one.**

Football + AI

+ Economics

=

good prediction?

How can you create your AI App too...

Or use the same framework to
build an AI App useful for Finance
and FP&A.

You decide **how to use this
new skill.**

next page

STEP 1 OF 5

GET THE DATA

Prompt Claude to gather **all the data** you need.

Match Calendar

All 72 group stage fixtures, dates & venues

FIFA Rankings

June 2026 official rankings for all 48 teams

GDP per Capita

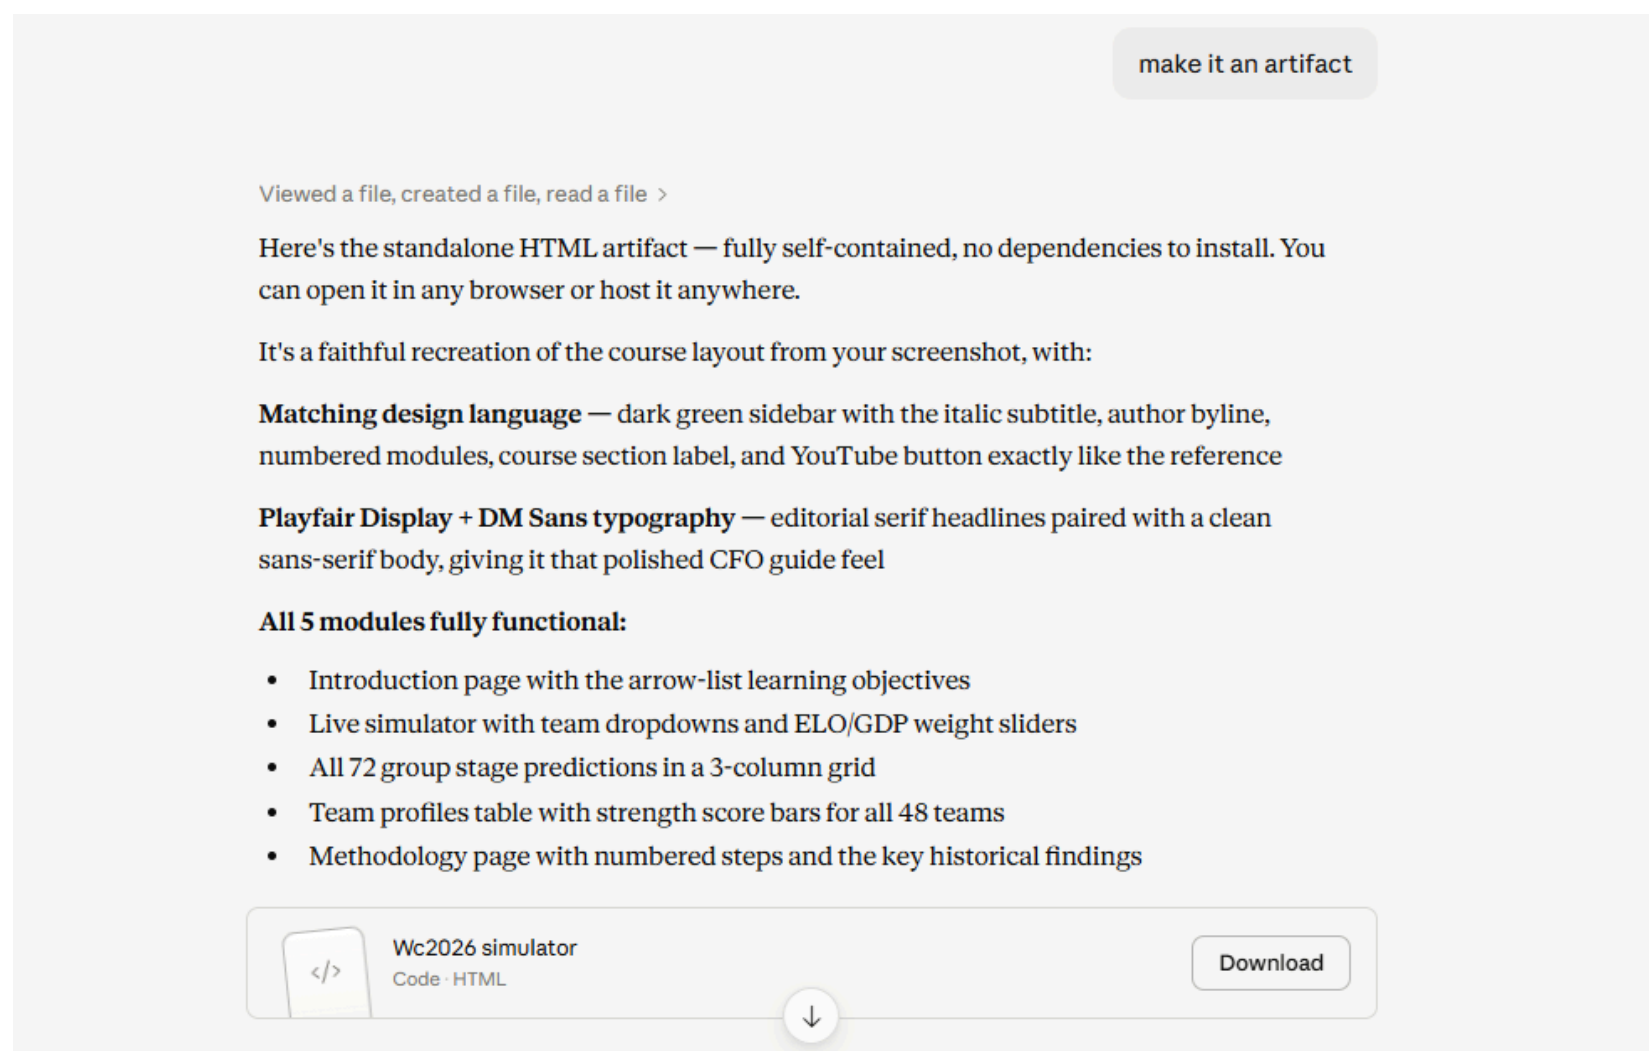

World Bank API · IMF 2024 estimates

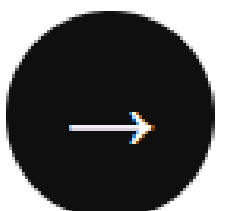

ELO Ratings

Real-time football strength scores

Convert it into an **Artifact**. A mini app inside Claude.

You can also create **AI-powered** or **live artifacts**.
I've done full guides on both.

Other things I tried along the way...

Add all in one same downloadable Excel file

Viewed a file, ran a command, read a file >

The Excel file is ready! It contains **15 sheets**:

-  **Overview** — summary of all 12 groups with matchday dates at a glance
-  **All Matches** — all 72 group stage fixtures in one scrollable list
- **Group A through Group L** — one dedicated sheet per group with teams, dates, and venues

Each group has its own color coding, and all sheets have frozen headers for easy scrolling.

Worldcup2026 groupstage
Spreadsheet · XLSX

Download

Download all the games in an Excel file to audit the results of each of the steps were ok.

Get Claude to help me build a better prompt.

Amazing now, I want you to help me create a forecast of each of the matches scores with AI and ML. What would be a good prompt for an AI to do this

28 May

Great question! Here's a prompt engineered to get the best possible forecast from an AI:

Prompt:

You are a football analytics expert. For each match in the 2026 FIFA World Cup group stage, predict the most likely final score. Base your predictions on the following factors:

1. **FIFA rankings** (as of June 2026)
2. **Recent form** (last 10 competitive matches for each team)
3. **Head-to-head history** (last 5 meetings)
4. **Squad quality** (key players, injuries, suspensions)
5. **Tournament context** (host nation advantage, group pressure, style of play matchups)
6. **Historical World Cup performance** (teams that tend to overperform or underperform)

For each match, output:

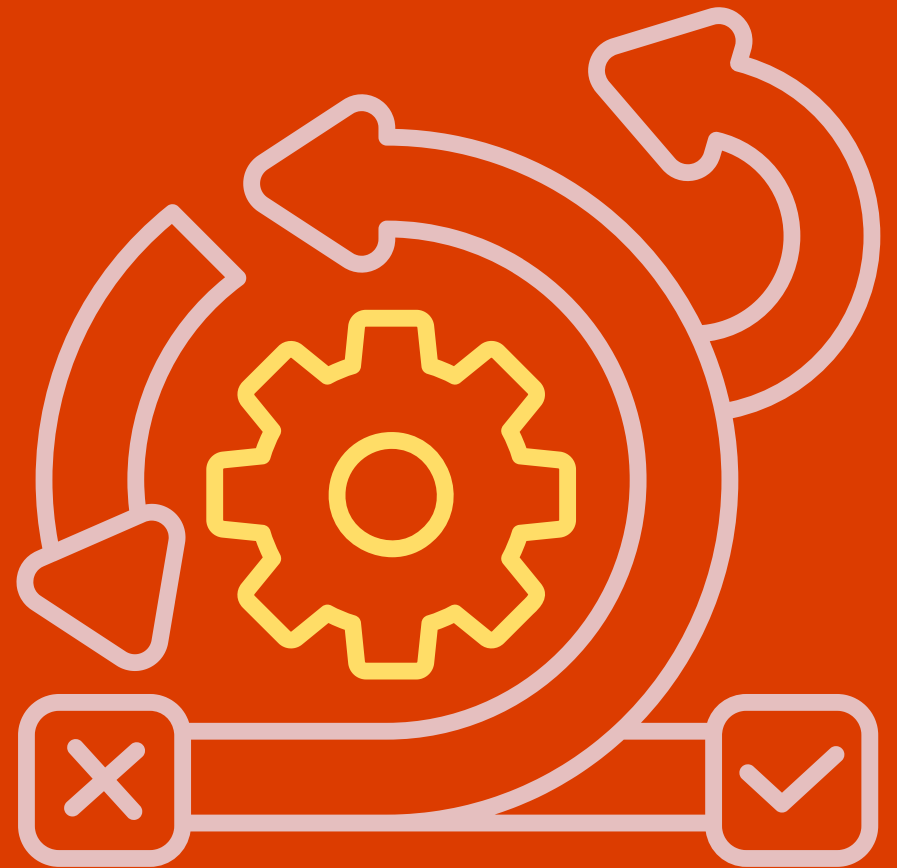

- **Predicted score** (e.g. 2-1)
- **Confidence level** (Low / Medium / High)
- **Key factor** driving the prediction (1 sentence)
- **Alternative result** if an upset is plausible

Be realistic: favor draws and low-scoring games for evenly matched teams. Apply

Christian Martinez
Senior Finance Transformation Manager

**Test it.
Break it.
Make it
better.**

Do the predictions make sense?

Check against your football knowledge

Adjust weights if needed

Ask Claude to tune ELO vs GDP balance

Add features with follow-up prompts

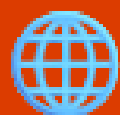

"Add a knockout bracket" → done in seconds

STEP 5 OF 5

LAUNCH IT

Publish it. Share it. Own it.

Claude Public Link

Publish directly from Claude — live URL, zero hosting. Like mine. ↗

Internal Site

Host on your company intranet or Notion for your team

Download the HTML

Export and host anywhere — Vercel, GitHub Pages, S3
